Batch 1-NH

Writing Terraform Scripts to perform the following task 2 ec2 Instances, VPN and S3
main.tf

```
1 terraform {
2   required_providers {
3     aws = {
4       source = "hashicorp/aws"
5       version = "5.31.0"
6     }
7   }
8 }
9
10
11 provider "aws" {
12   region     = "us-east-2" # Replace with your preferred region
13   access_key = "AKIA2BRNT5GDAUSV6HHL" # Replace with your Access Key
14   secret_key = "pG9zlee+DdGmrjAdy9V4EF3oAUomjOMNfmWf2RIH" # Replace with your Secret Key
15 }
```

Running terraform init

```
PS C:\SID_DATA\SIDDHARTH\UPES COLLEGE STUDY MATERIAL\SEM6\SPCM\lab\Assignment-1> terraform init
Initializing the backend...
Initializing provider plugins...
- Finding hashicorp/aws versions matching "5.31.0"...
- Installing hashicorp/aws v5.31.0...
- Installed hashicorp/aws v5.31.0 (signed by HashiCorp)
Terraform has created a lock file .terraform.lock.hcl to record the provider
selections it made above. Include this file in your version control repository
so that Terraform can guarantee to make the same selections by default when
you run "terraform init" in the future.

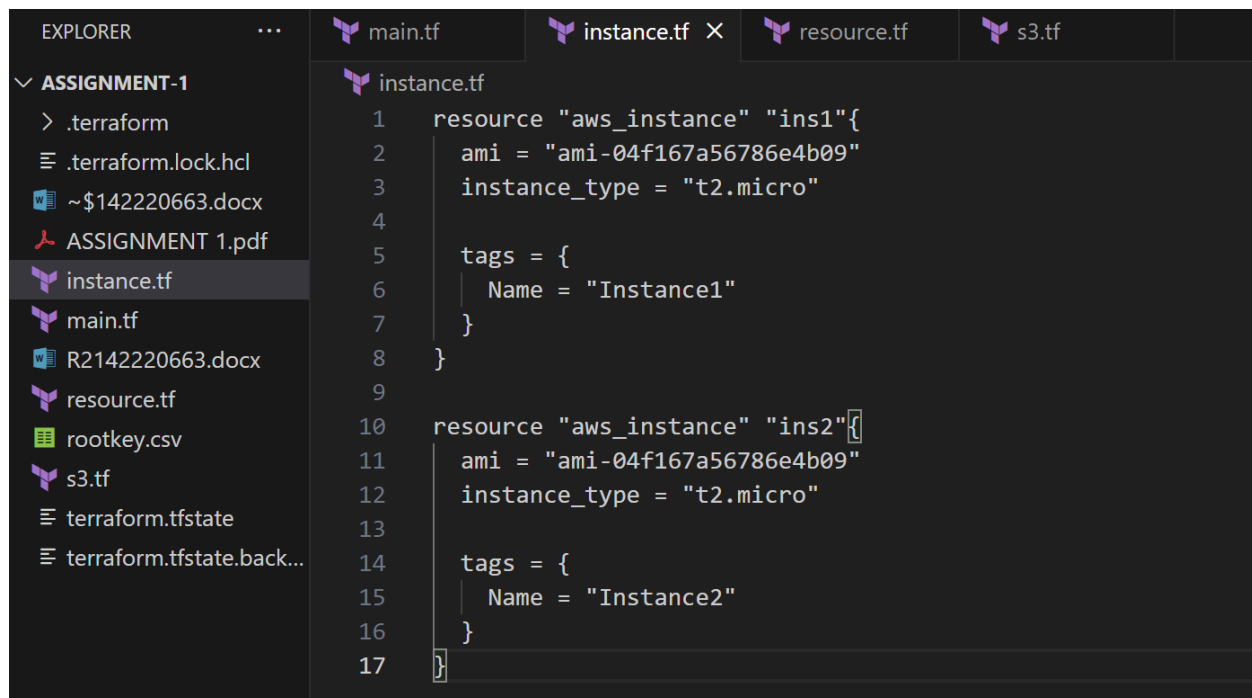

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.

If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.
PS C:\SID_DATA\SIDDHARTH\UPES COLLEGE STUDY MATERIAL\SEM6\SPCM\lab\Assignment-1> terraform plan
```

Terraform init to initialize the terraform folder which will have the aws provider plugin installed

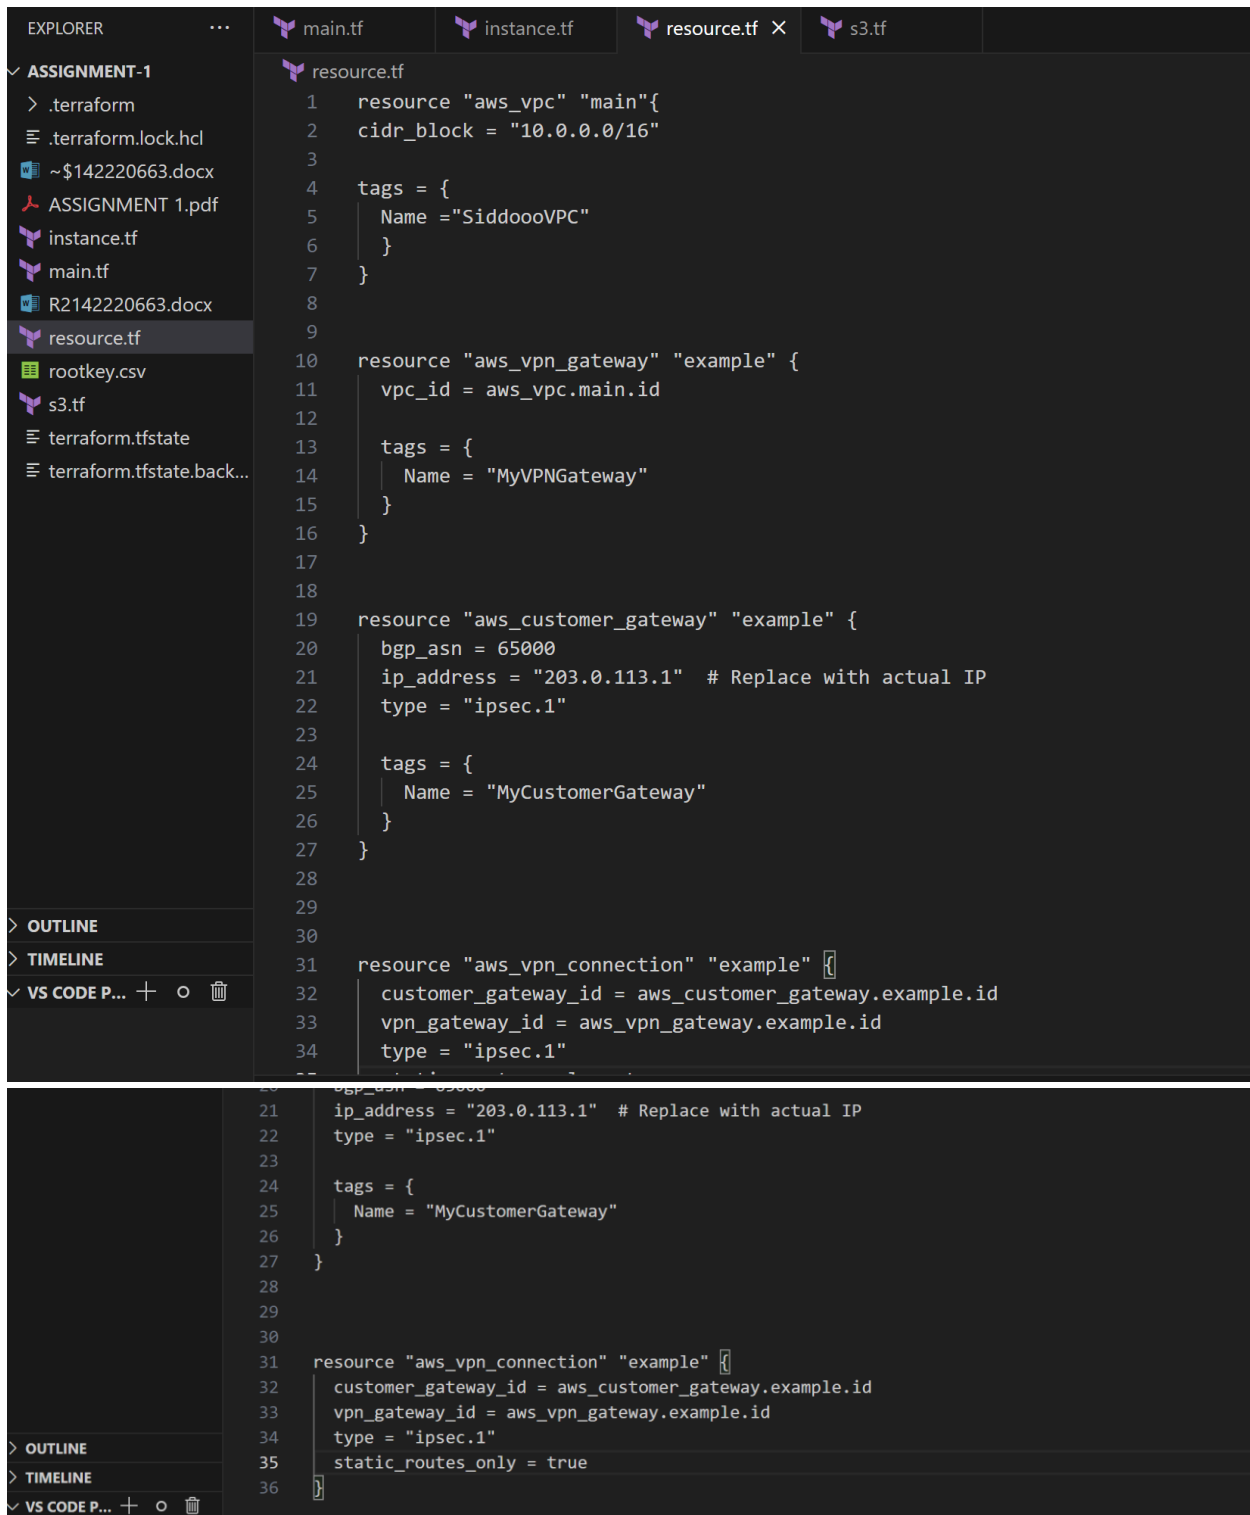

instance.tf

```
1  resource "aws_instance" "ins1"{
2      ami = "ami-04f167a56786e4b09"
3      instance_type = "t2.micro"
4
5      tags = {
6          Name = "Instance1"
7      }
8  }
9
10 resource "aws_instance" "ins2"{
11     ami = "ami-04f167a56786e4b09"
12     instance_type = "t2.micro"
13
14     tags = {
15         Name = "Instance2"
16     }
17 }
```

This file holds the iac code to make 2 instances - t2-micro ec2 machines

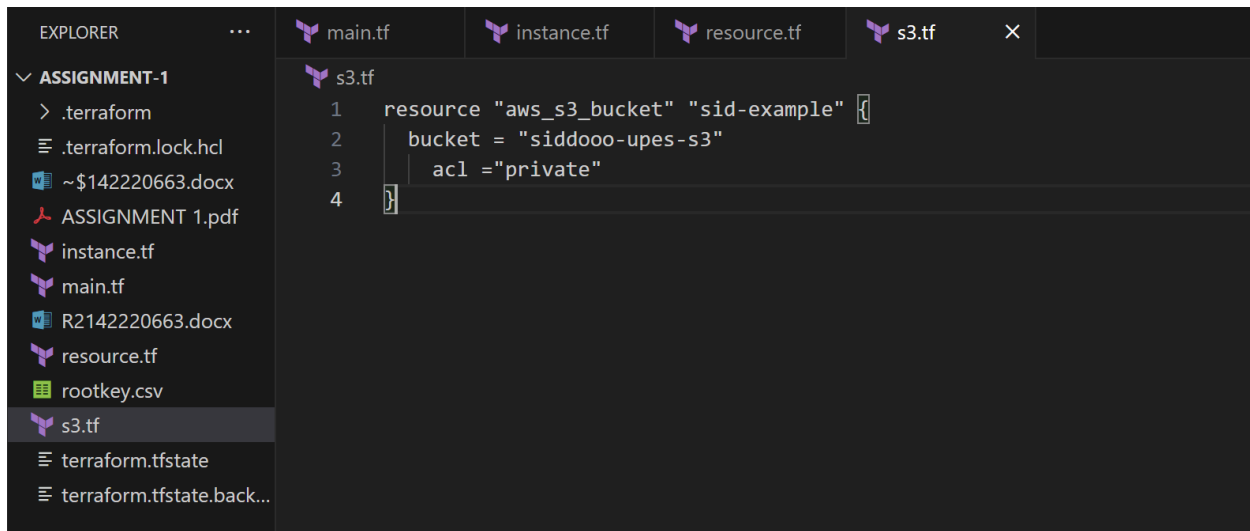

resource.tf

```
1  resource "aws_vpc" "main"{
2    cidr_block = "10.0.0.0/16"
3
4    tags = {
5      Name = "SiddoooVPC"
6    }
7  }
8
9
10 resource "aws_vpn_gateway" "example" {
11   vpc_id = aws_vpc.main.id
12
13   tags = {
14     Name = "MyVPNGateway"
15   }
16 }
17
18
19 resource "aws_customer_gateway" "example" {
20   bgp_asn = 65000
21   ip_address = "203.0.113.1" # Replace with actual IP
22   type = "ipsec.1"
23
24   tags = {
25     Name = "MyCustomerGateway"
26   }
27 }
28
29
30
31 resource "aws_vpn_connection" "example" {
32   customer_gateway_id = aws_customer_gateway.example.id
33   vpn_gateway_id = aws_vpn_gateway.example.id
34   type = "ipsec.1"
35   static_routes_only = true
36 }
```

This resource.tf hold the iac code to create vpc , the customer gateway and the vpn connection.

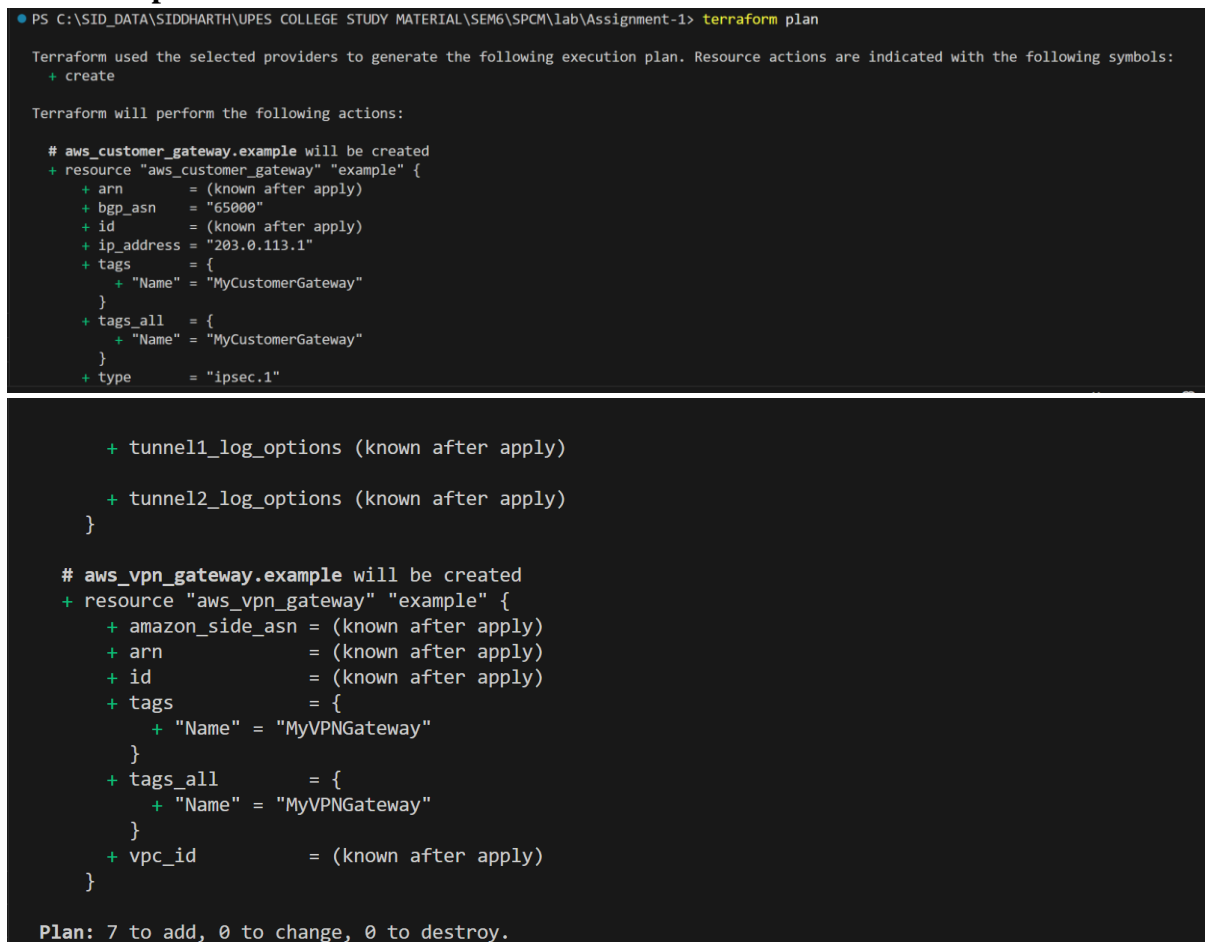

s3.tf

The s3.tf hold the code to create a s3 bucket which has a unique name

Outputs:

terraform plan

Terraform apply

```
PS C:\SID_DATA\SIDDHARTH\UPES COLLEGE STUDY MATERIAL\SEM6\SPCM\lab\Assignment-1> terraform apply -auto-approve
```

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:
+ create

Terraform will perform the following actions:

```
# aws_customer_gateway.example will be created
+ resource "aws_customer_gateway" "example" {
  + arn          = (known after apply)
  + bgp_asn      = "65000"
  + id          = (known after apply)
  + ip_address   = "203.0.113.1"
  + tags        = {
    + "Name" = "MyCustomerGateway"
  }
  + tags_all     = {
    + "Name" = "MyCustomerGateway"
  }
  + type         = "ipsec.1"
}

# aws_instance.ins1 will be created
+ resource "aws_instance" "ins1" {
  + ami                    = "ami-04f167a56786e4b09"
  + arn                   = (known after apply)
  + associate_public_ip_address = (known after apply)
  + availability_zone      = (known after apply)
  + cpu_core_count        = (known after apply)
  + cpu_threads_per_core  = (known after apply)
  + disable_api_stop      = (known after apply)
  + disable_api_termination = (known after apply)
  + ebs_optimized         = (known after apply)
  + get_password_data     = false
}
```

```
3:    acl = "private"
```

Use the `aws_s3_bucket_acl` resource instead

(and 2 more similar warnings elsewhere)

(and 2 more similar warnings elsewhere)

(and 2 more similar warnings elsewhere)

Apply complete! Resources: 7 added, 0 changed, 0 destroyed.

```
PS C:\SID_DATA\SIDDHARTH\UPES COLLEGE STUDY MATERIAL\SEM6\SPCM\lab\Assignment-1> █
```
